DM FOR LIQUID COOLING

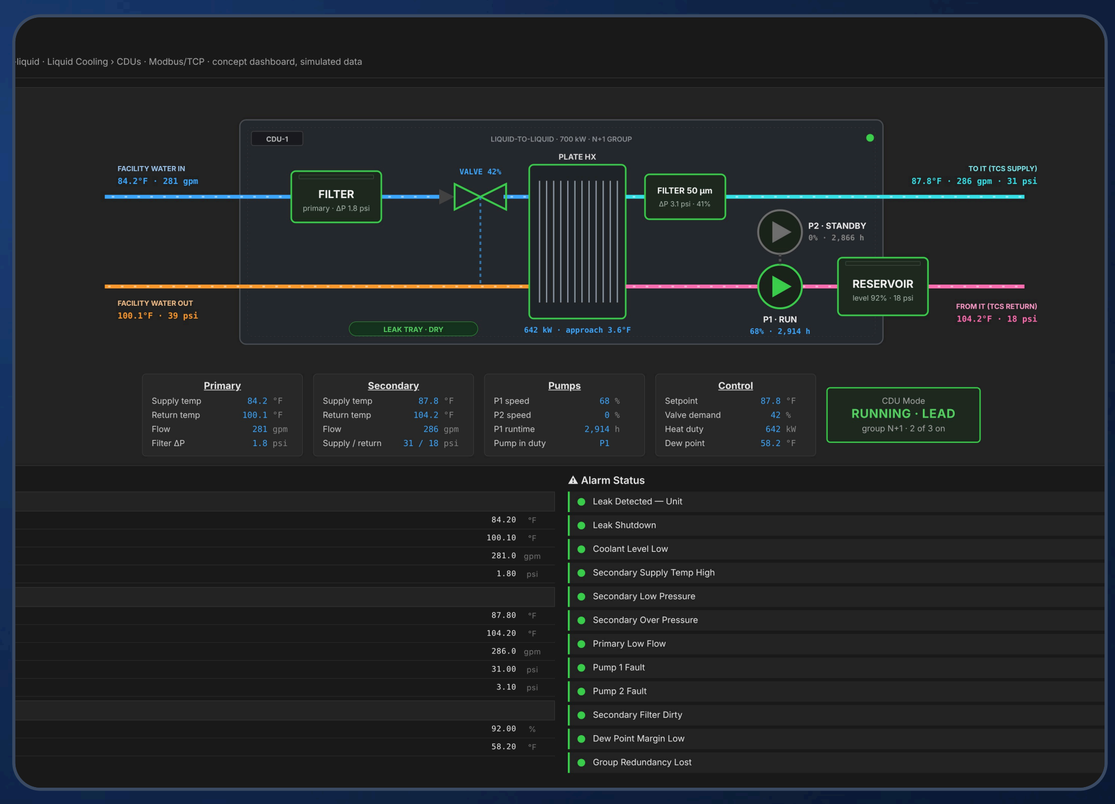

From the cooling tower to the chip. Every loop, one DM.

Cooling towers, water treatment, CDUs, rack manifolds, cold plates and servers, live in one console, with leak alarms that go straight to the right people and the water chemistry that keeps cold plates clean.

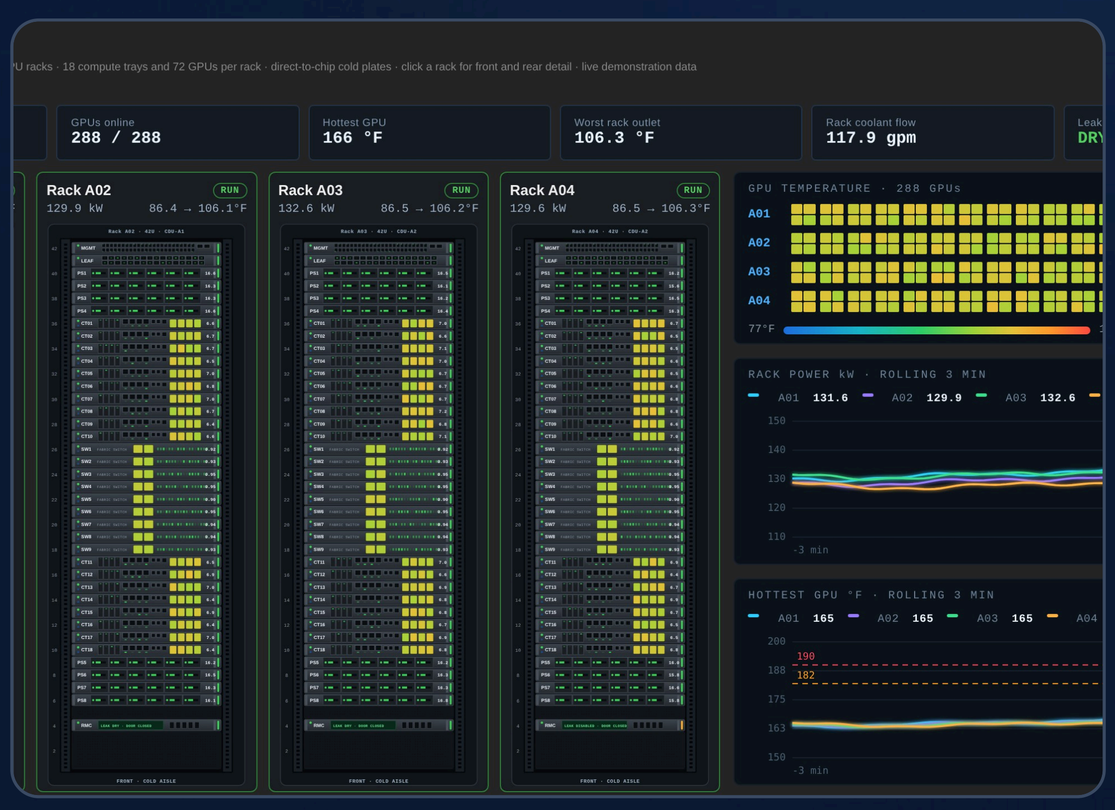

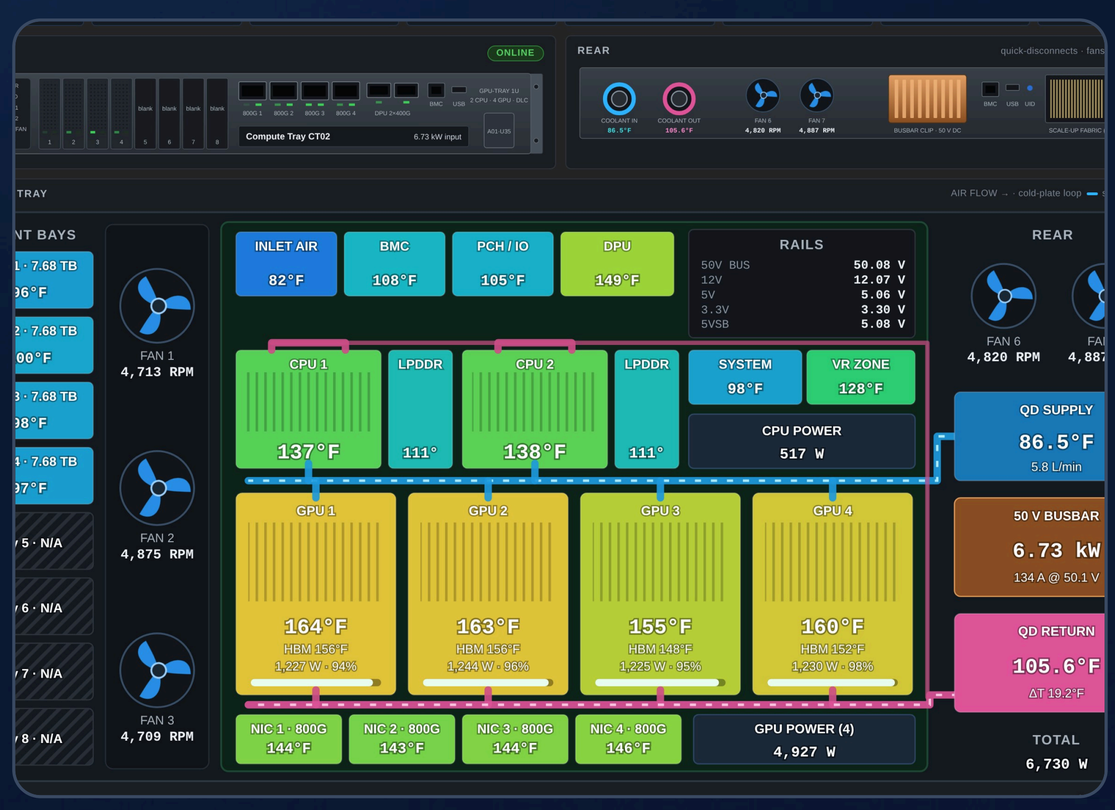

Liquid cooling plant, towers to racks.

CDU dashboard: temperatures, flow, pumps, filters.

GPU racks: four liquid-cooled racks, 288 GPU temperatures at a glance.

Inside a compute tray: every CPU and GPU on its cold plate, coolant in and out.
